Fundamental Objects
foReports

Overview

While the front end data entry software is the focus of most web development, the portion that becomes the most important aspect to companies in the end, is Reporting. **foReports** is an online adhoc report writer, which was created to address the needs of companies that are often forced to spend too much—just to create the reports that they need to view their own data.

It can be difficult to create specifications for customized reports and it can be costly to have the actual work done ($1,000-$7,000k per report is not uncommon).

Users are often forced into a situation where they have to return to (internal or external) development teams to do more reports—when they would be just as happy to do the work themselves, if they could. This is even true in large companies, with full IT teams—because these IT teams can be either slow to act—or not decentralized enough to react to actual client needs.
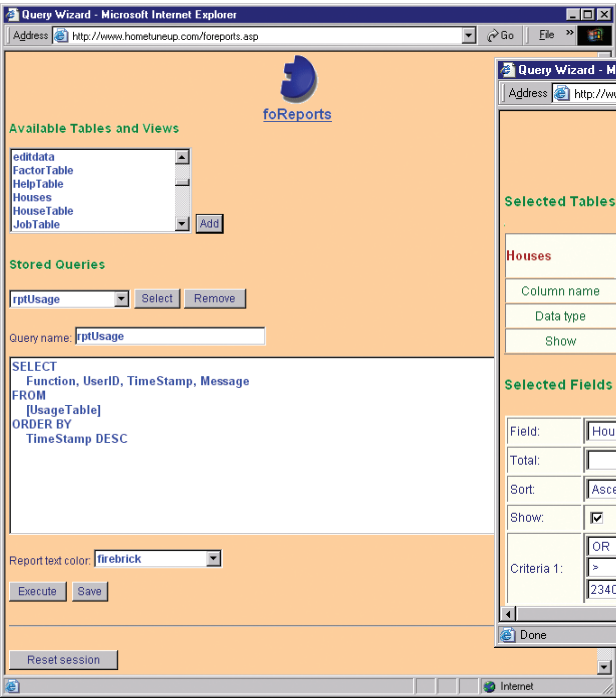

foReports allows companies to access their own data, without requiring additional programming in order to do so.

foReports is unique based on its flexibility, ease of use, and availability of source code.
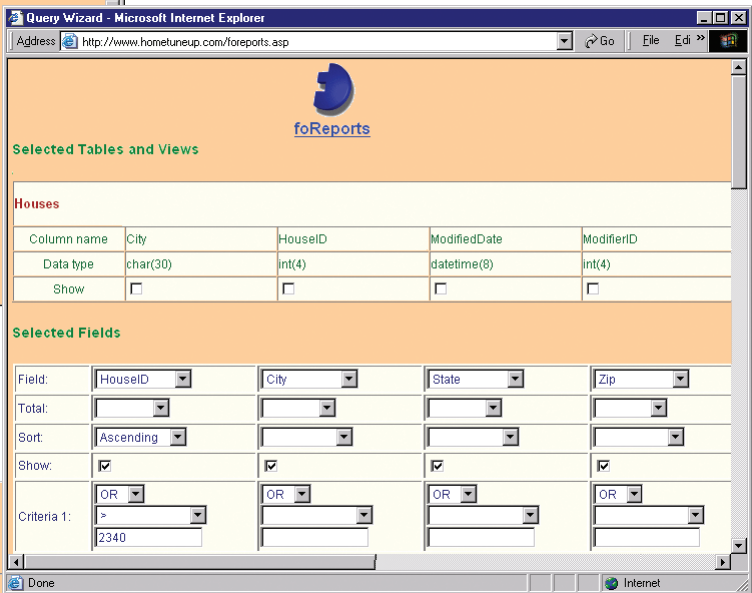

foReports works similar to Microsoft Access' Query Designer. But it sits on the web and works directly against a customer's Access or SQL Server database.

This tool can be integrated within a customers' application or used as a standalone tool on the web. It can also be used on a local, internal intranet site.

foReports

Major Features

- **foReports** can be added into existing intra/internet applications.
- **foReports** is accessible from any internet connection.
- **foReports** automatically picks up your tables and queries, no coding is required.
- Security is provided at the View level—supporting your own database security model.
- Online Drag and drop of fields is used to create the queries.

- Users can play with the data, before creating the actual report.
- Users can create and save their own individual reports.
- Sorting and Grouping is supported.
- Adding criteria to the data is supported. (eg. Where State="PA")
- A **foReports** version that can generate mobile-ready web pages is available.

foReports Requirements:

- Windows 200x Server
- Internet Information Server 6.0+
- **FO** also provides web site and database hosting, and can run **foReports** for your company remotely.

foReports Pricing:

- 4,000k if hosted by **FO** (and pointing at your database).
- A single server licensing, source code version is also available.
